

Heat Energy

Mr. Skirbst

What is heat?

Heat - the *energy* involved in the *internal motion* of particles

HIGHER
TEMPERATURE

ENERGY AS HEAT FLOW
ALWAYS MOVES FROM A

HIGHER TEMPERATURE
TO A LOWER
TEMPERATURE.

HEAT
WILL FLOW

AS LONG AS
ONE TEMPERATURE IS
HIGHER THAN ANOTHER.

LOWER
TEMPERATURE

Movement - from
high energy (hot)
to *low energy (cold)*

3 Types of Heat Transfer

Hot

Heat flows due to:

Conduction

Convection

Radiation

Cold

1. Conduction

- transfer through direct
contact

- (ex. hand on window, or pot)

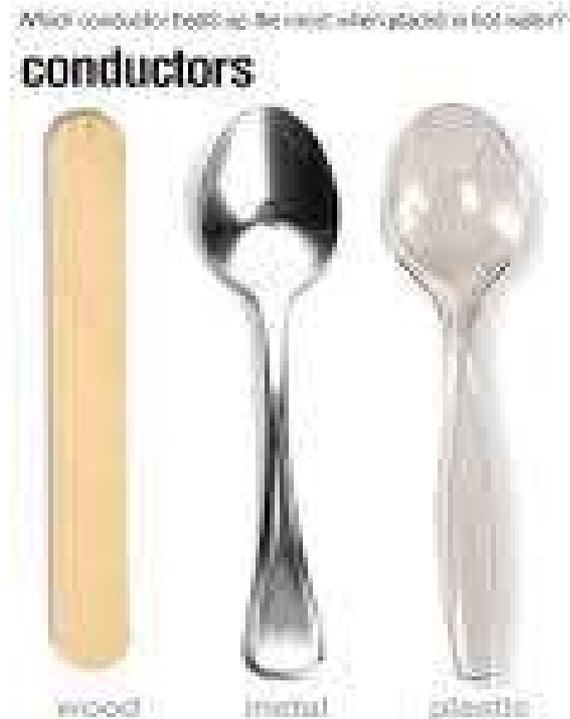

Conduction

Energy is transferred by direct contact.

- **Conductor** – *does* transfer heat well

- (ex. metal)

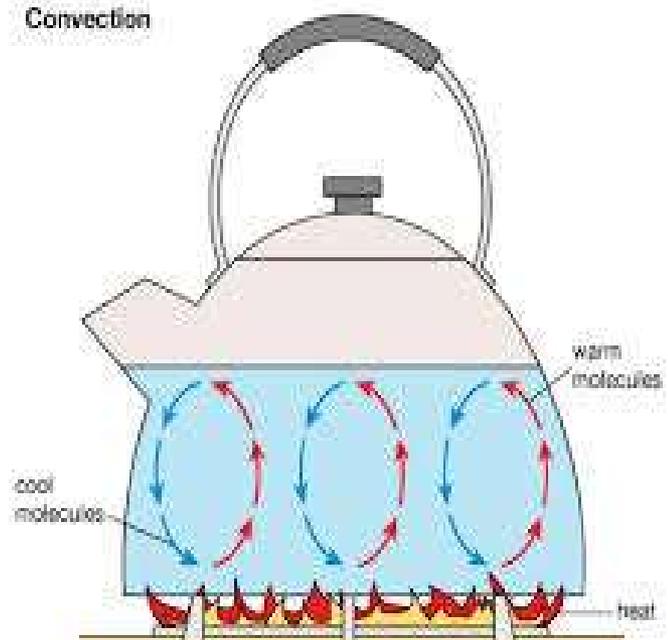

- **Insulator** – does *not* transfer heat well
- (ex. styrofoam)

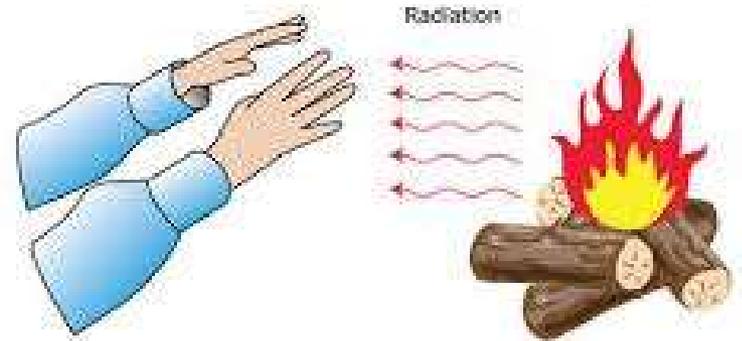

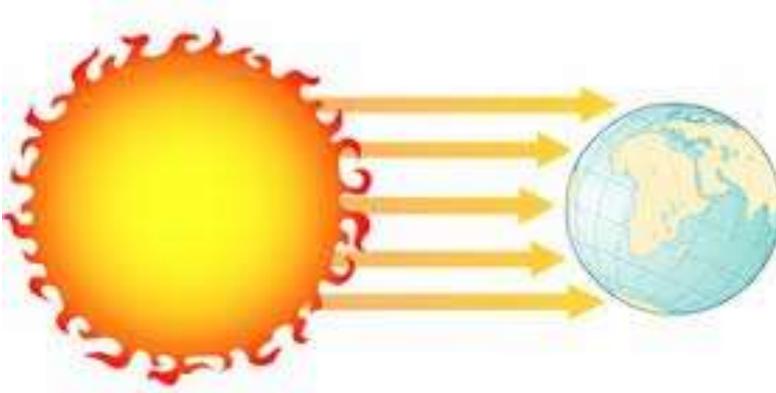

2. Convection

- transfer through a *liquid or gas*
- (ex. boiling water or atmosphere)

3. Radiation

- transfer through *empty space* (*vacuum*)
- (ex. energy from sun, infrared rays from a fire)

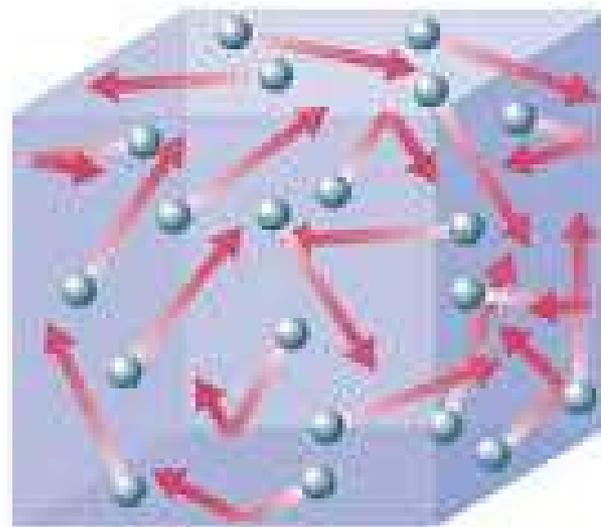

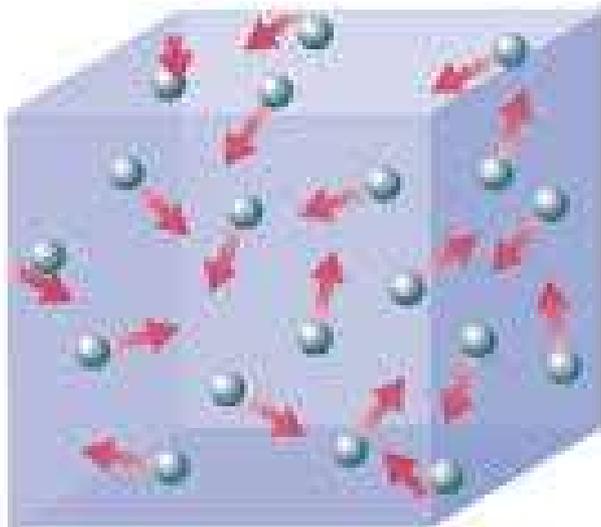

How is Heat Measured?

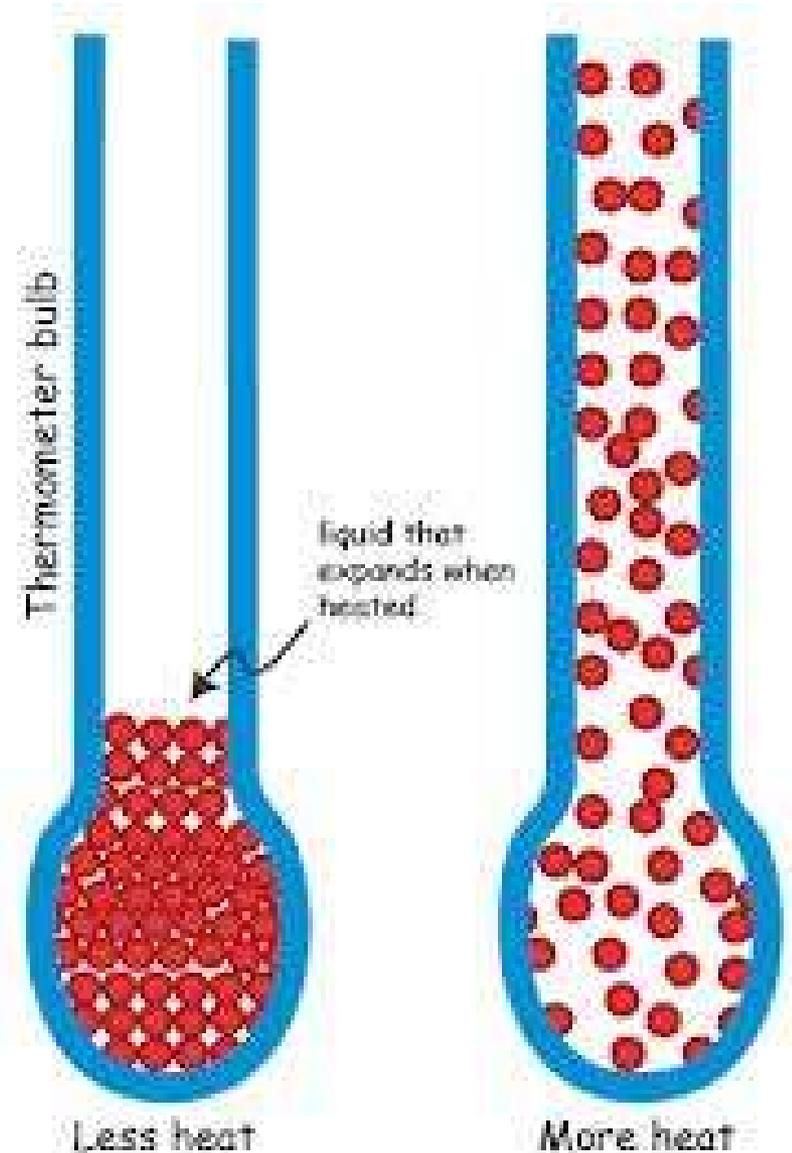

Temperature

- measures the *average kinetic energy* (energy of motion) of molecules

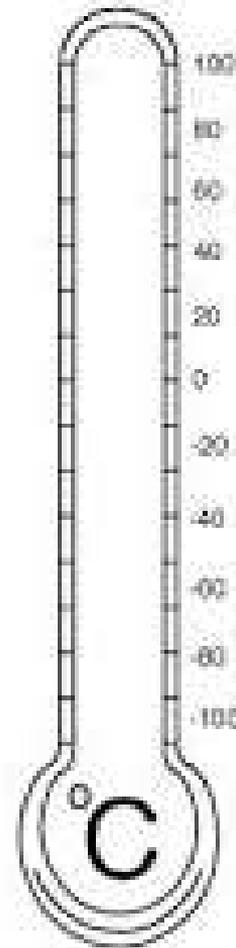

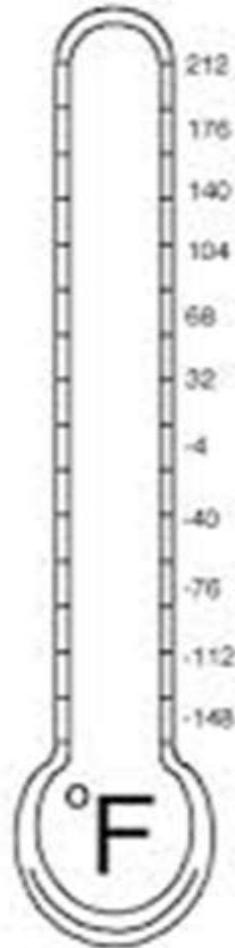

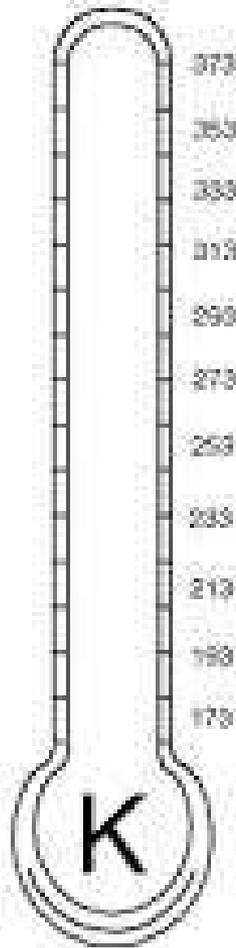

Longer arrows mean higher average speed.

Thermometer –
instrument used to
measure
temperature

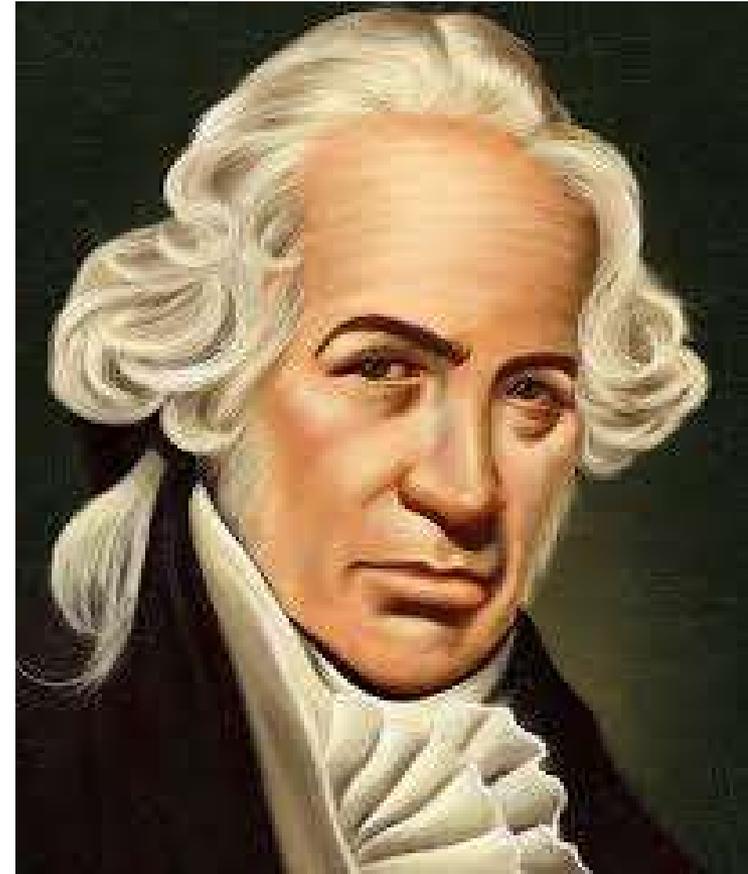

3 Temperature Scales

1. Fahrenheit

- based on an ice/salt mixture and body temperature

2. Celsius

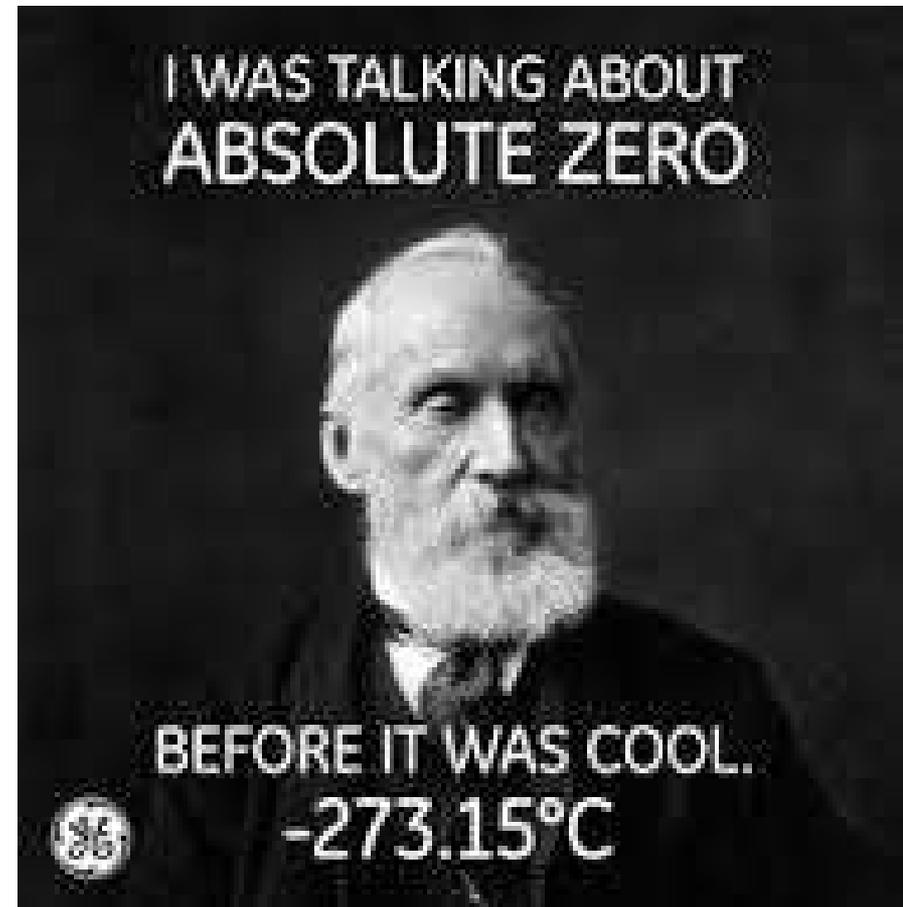

- based on freezing and boiling points of water

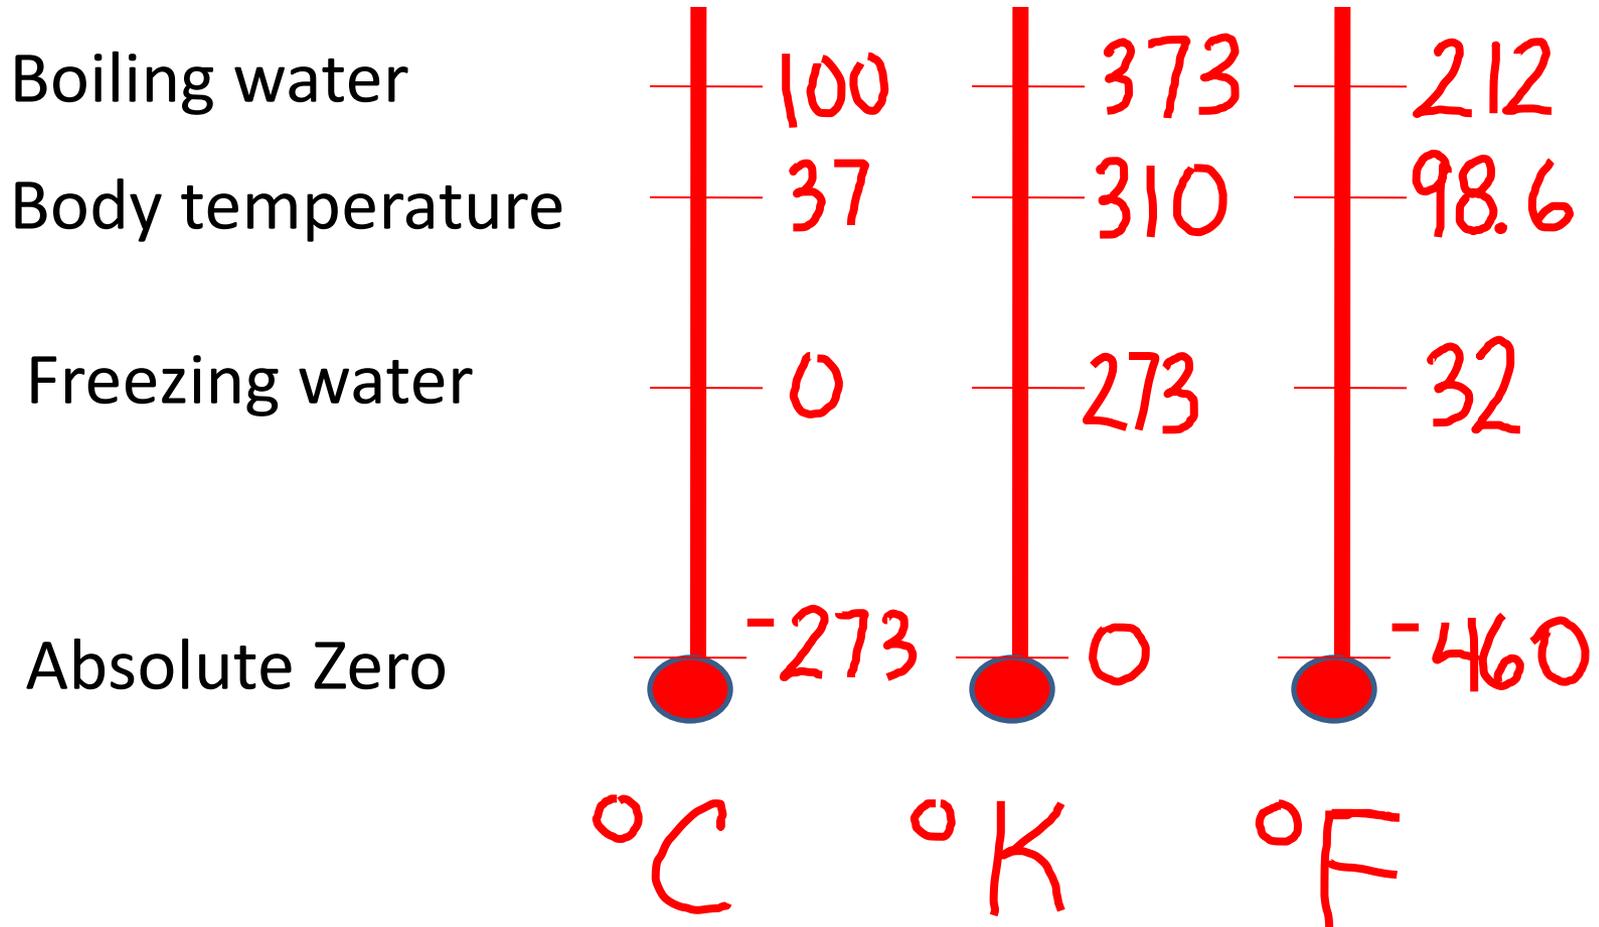

Anders Celsius
(1701-1744)

3. Kelvin

- based on absolute zero (point at which all molecular motion stops)

Comparisons:

What is the unit of heat?

The Calories in these items could:

5 lbs of spaghetti

Brew a pot of coffee

1 piece of cherry cheesecake

Light a bulb for 1.5 hours

217 Big Macs

Drive a car 88 miles

calorie – unit of heat

calorie – unit of heat

- the heat energy needed to raise the temp of *1 gram of water 1 degree Celsius*

calorie – unit of heat

- the heat energy needed to raise the temp of *1 gram of water 1 degree Celsius*
- *ex. 5 calories needed to raise temp of 1 g 5°C*

Specific Heat

Specific heat

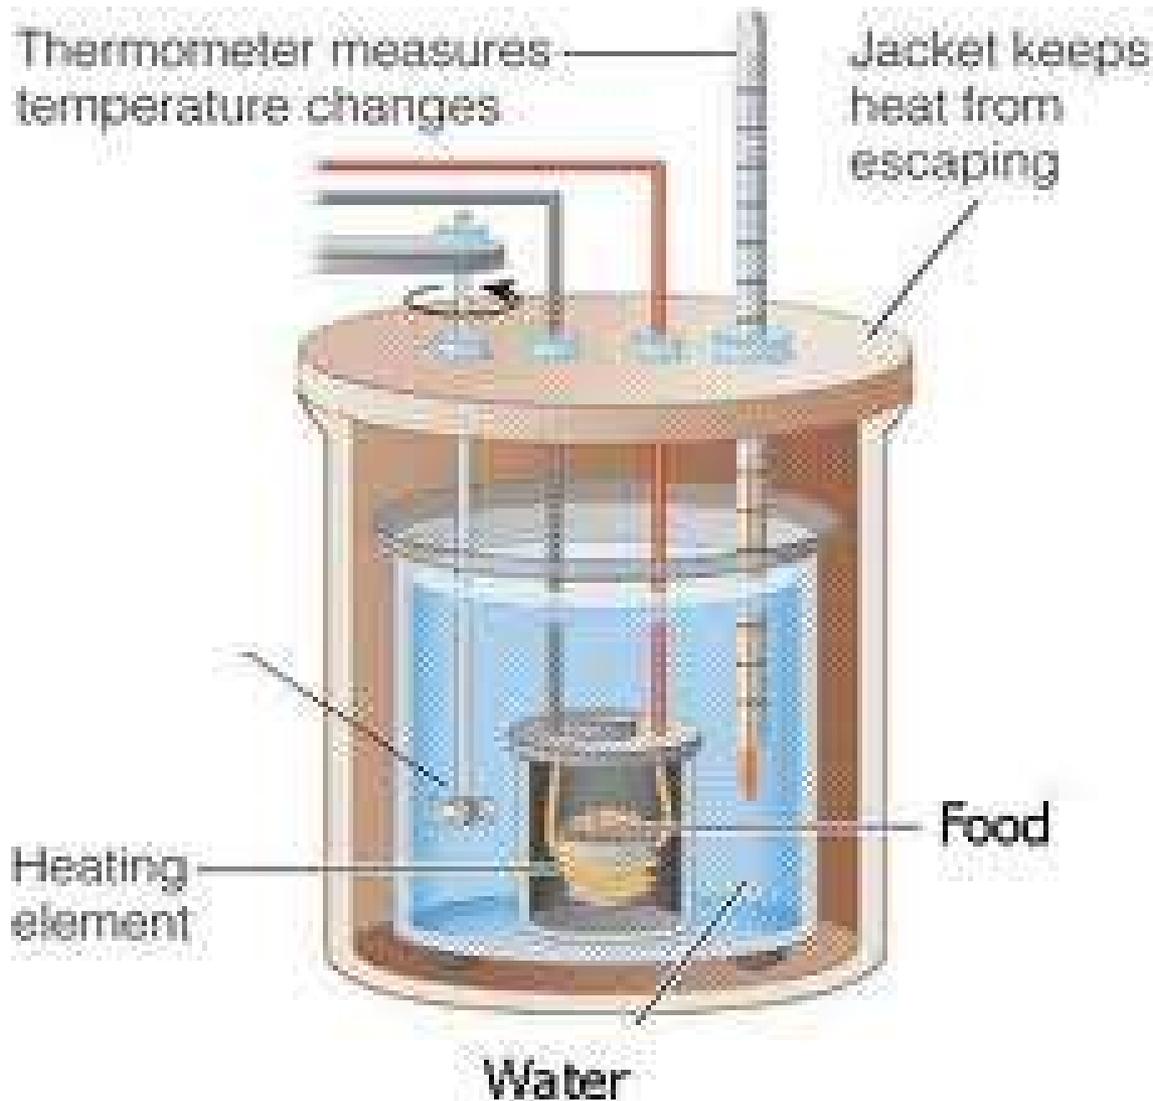

- ability of a substance to *absorb*
heat energy

- number of *calories* needed to raise the temp of 1 gram of water 1 degree Celsius

Specific heat of WATER =

1.00 cal/g°C

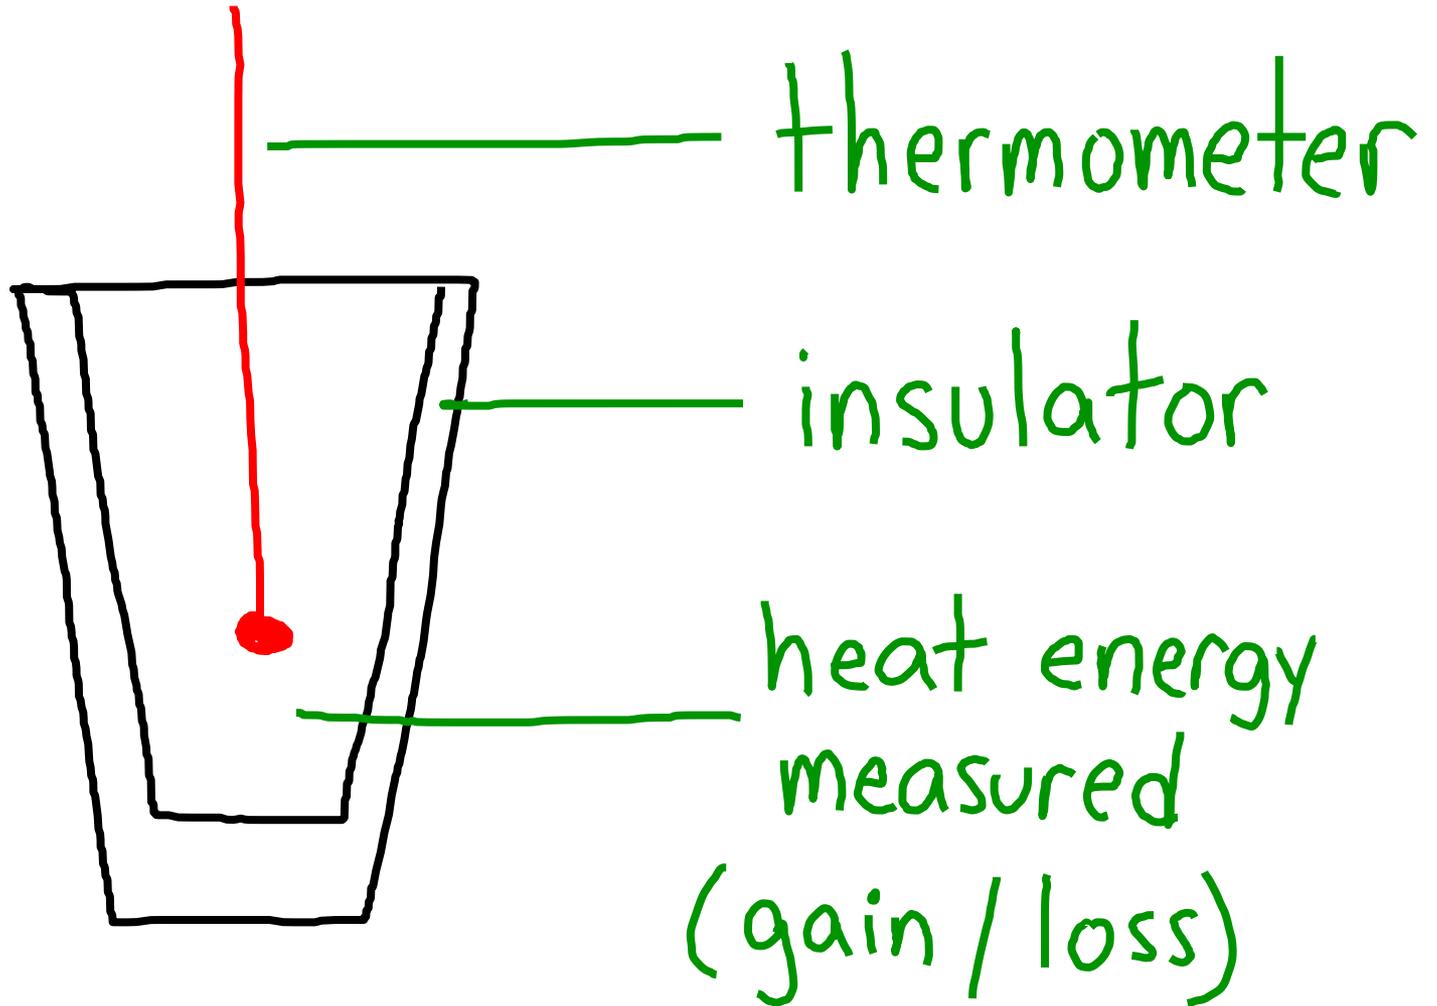

Calculating heat energy

Calculating heat energy

Calorimeter - device used to
measure *heat gain / loss*

Calorimeter

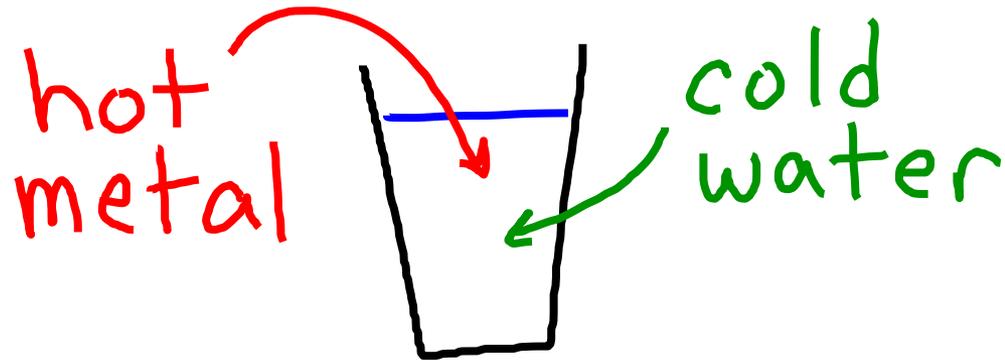

Heat Equation

$$\text{HEAT} = \text{mass} \times \Delta T \times \text{sp.ht.}$$

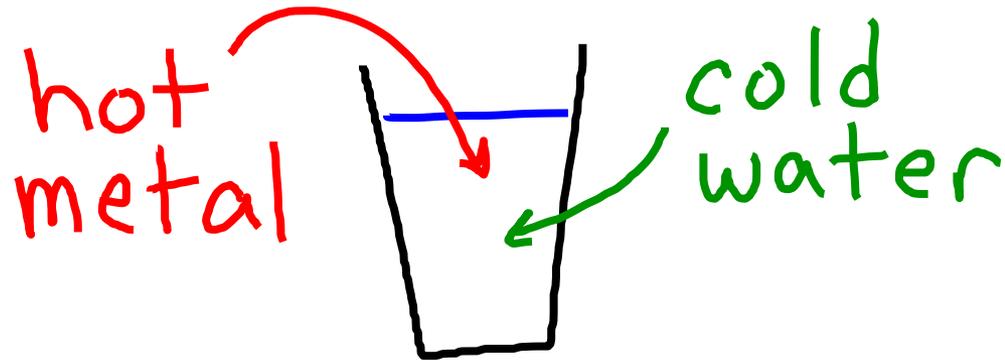

Heat Equation

$$\begin{array}{ccccccc} \text{HEAT} & = & \text{mass} & \times & \Delta T & \times & \text{sp.ht.} \\ (\text{cal.}) & & (\text{g}) & & (^\circ\text{C}) & & (\text{cal./g}^\circ\text{C}) \\ (\text{gain/loss}) & & & & & & \end{array}$$

Lab Activity

Lab Activity

$$\begin{array}{l} \text{Metal} \\ \text{(heat loss)} \end{array} = \begin{array}{l} \text{Water} \\ \text{(heat gain)} \end{array}$$

Metal
(heat loss) = Water
(heat gain)

$$M_m \times \Delta T_m \times \text{spht}_m = M_w \times \Delta T_w \times \text{spht}_w$$

$$\frac{M_m \times \Delta T_m \times \text{spht}_m}{m_a \times \Delta T_m} \neq \frac{M_w \times \Delta T_w \times \text{spht}_w}{m_m \times \Delta T_m}$$

$$\text{Sp.ht}_m = \frac{m_w \cdot \Delta T_w \cdot sh_w}{m_m \cdot \Delta T_m}$$

Water:

Mass (g): _____

Initial temp. (°C): _____

Final temp. (°C): _____

Change in temp. (°C): _____

Sp. Ht.: _____

Metal:

Mass (g): _____

Initial temp (°C): _____

Final Temp (°C): _____

Change in temp. (°C): _____

Sp. Ht.: _____

Remember:

$$\mathbf{heat = (mass) \times (temp. \ change) \times (sp.ht.)}$$

Water

Mass = 100g

I. temp = 20°C

F. temp = _____

Δ temp = _____

Sp. Ht = 1

metal

mass = _____

I temp = 100°

F. temp = _____

Δ temp = _____

spht. _____
